A Proof of Theorems and Propositions

A.1 Proof of Theorem 1

The variance of a mixture estimator is

$$\mathbb{V}[\hat{V}_\alpha] = \sum_{i=1}^{M} \alpha_i^2 \mathbb{V}[\hat{V}_i].$$

The variance of $\hat{V}_{MIX}$ is

$$\mathbb{V}[\hat{V}_{MIX}] = \sum_{i=1}^{M} \frac{1}{(\mathbb{V}[\hat{V}_i] \sum_{j=1}^{M} \frac{1}{\mathbb{V}[\hat{V}_j]})^2} \mathbb{V}[\hat{V}_i]$$
$$= \frac{1}{\sum_{i=1}^{M} \frac{1}{\mathbb{V}[\hat{V}_i]}}. \tag{11}$$

Therefore,

$$\frac{\mathbb{V}[\hat{V}_\alpha]}{\mathbb{V}[V_{MIX}]} = \sum_{i=1}^{M} \frac{1}{\mathbb{V}[\hat{V}_i]} \sum_{i=1}^{M} \alpha_i^2 \mathbb{V}[\hat{V}_i]$$
$$\geq (\sum_{i=1}^{M} |\alpha_i|)^2$$
$$\geq (|\sum_{i=1}^{M} \alpha_i|)^2 = 1. \tag{12}$$

This means that any mixture estimator other than $\hat{V}_{MIX}$ has higher or equal variance.

A.2 Proof of Proposition 1

The unbiasedness is proved as

$$\mathbb{E}[\hat{V}_{MIXT} - V] = \mathbb{E}[\sum_{t=0}^{T} \sum_{i=1}^{M} \alpha_{i,t} \hat{V}_{i,t} - \sum_{t=0}^{T} V_t]$$
$$= \mathbb{E}[\sum_{t=0}^{T} \sum_{i=1}^{M} \alpha_{i,t} (\hat{V}_{i,t} - V_t)]$$
$$= \sum_{t=0}^{T} \sum_{i=1}^{M} \alpha_{i,t} \mathbb{E}[(\hat{V}_{i,t} - V_t)]$$
$$= 0. \tag{13}$$

The variance of $\hat{V}_{MIXT}$ is

$$\mathbb{V}[\hat{V}_{MIXT}] = \sum_{i=1}^{M} \left(\sum_{t=0}^{T} \alpha_{i,t}^2 \mathbb{V}[\hat{V}_{i,t}] + 2 \sum_{1 \leq t_1 < t_2 \leq T} \alpha_{i,t_1} \alpha_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{V}_{i,t_2}] \right), \tag{14}$$

where $\forall t$, $\sum_{i=1}^{M} \alpha_{i,t} = 1$. We construct the Lagrangian function for the problem

$$\mathcal{L}[A, \Lambda] = \sum_{i=1}^{M} \left(\sum_{t=0}^{T} \alpha_{i,t}^2 \mathbb{V}[\hat{V}_{i,t}] + 2 \sum_{1 \leq t_1 < t_2 \leq T} \alpha_{i,t_1} \alpha_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{V}_{i,t_2}] \right) - \sum_{t=0}^{T} \lambda_t (\sum_{i=1}^{M} \alpha_{i,t} - 1), \tag{15}$$

where λ_t are Lagrangian multipliers. Let $\frac{\partial \mathcal{L}}{\partial \alpha_{i,t}} = 0$ and $\frac{\partial \mathcal{L}}{\partial \lambda_t} = 0$, we get

$$\forall i \forall t \quad 2\mathbb{V}[\hat{V}_{i,t}]\alpha_{i,t} + 2\sum_{\tau \neq t} \alpha_{i,\tau} Cov[\hat{V}_{i,t}, \hat{V}_{i,\tau}] = \lambda_t, \tag{16}$$

$$\forall t \quad \sum_{i=1}^{M} \alpha_{i,t} = 1. \tag{17}$$

We denote $[\lambda_0, \lambda_1, ..., \lambda_T]^T$ by $\overrightarrow{\Lambda}$. From (16) we know that $\forall i \ 2\Sigma_i \overrightarrow{\alpha}_i^* = \overrightarrow{\Lambda}$, which means $\forall i \ \overrightarrow{\alpha}_i^* = \frac{1}{2}\Sigma_i^{-1}\overrightarrow{\Lambda}$. Add up (17), and we get $\overrightarrow{e} = \sum_{i=1}^{M} \overrightarrow{\alpha}_i^* = \frac{1}{2}\sum_{i=1}^{M} \Sigma_i^{-1}\overrightarrow{\Lambda}$, which means $\frac{1}{2}\overrightarrow{\Lambda} = (\sum_{i=1}^{M} \Sigma_i^{-1})^{-1}\overrightarrow{e}$. Therefore, $\forall i \ \overrightarrow{\alpha}_i^* = \Sigma_i^{-1}(\sum_{i=1}^{M} \Sigma_i^{-1})^{-1}\overrightarrow{e}$. We have found a stationary point of (14), so now we need to show that it is the global minima. Note that the solutions of (17) forms a convex set on $R^{M \times T}$. In addition, because all the covariance matrixes are positive definite, $\mathbb{V}[\hat{V}_{MIXT}]$ is also a strictly convex function of $\overrightarrow{\alpha}$. Therefore, $\overrightarrow{\alpha}_i^*$ are the local minima as well as the global minima.

To prove the variance reduction, we rewrite $\hat{V}_{MIX}$ as

$$\hat{V}_{MIX} = \sum_{i=1}^{M} \sum_{t=0}^{T} \alpha_i V_{i,t}. \tag{18}$$

Note that $\alpha_{i,t}$ are the optimal mixture weights to minimize variance, so $\mathbb{V}[\hat{V}_{MIXT}] \leq \mathbb{V}[\hat{V}_{MIX}]$.

A.3 Proof of Proposition 2

The variance of V_{MIXC} is

$$\mathbb{V}[\hat{V}_{MIXC}] = \sum_{i=1}^{M} \sum_{t_1=0}^{T} \sum_{t_2=0}^{T} (\alpha_{i,t_1}\alpha_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{V}_{i,t_2}] + \beta_{i,t_1}\beta_{i,t_2} Cov[\hat{W}_{i,t_1}, \hat{W}_{i,t_2}]$$
$$+ \alpha_{i,t_1}\beta_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{W}_{i,t_2}] + \beta_{i,t_1}\alpha_{i,t_2} Cov[\hat{W}_{i,t_1}, \hat{V}_{i,t_2}]). \tag{19}$$

Like in A.2. We construct the Lagrangian function for it by

$$\mathcal{L}[A, B, \Lambda] = \sum_{i=1}^{M} \sum_{t_1=0}^{T} \sum_{t_2=0}^{T} (\alpha_{i,t_1}\alpha_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{V}_{i,t_2}] + \beta_{i,t_1}\beta_{i,t_2} Cov[\hat{W}_{i,t_1}, \hat{W}_{i,t_2}]$$
$$+ \alpha_{i,t_1}\beta_{i,t_2} Cov[\hat{V}_{i,t_1}, \hat{W}_{i,t_2}] + \beta_{i,t_1}\alpha_{i,t_2} Cov[\hat{W}_{i,t_1}, \hat{V}_{i,t_2}])$$
$$- \sum_{t=0}^{T} \lambda_t (\sum_{i=1}^{M} \alpha_{i,t} - 1). \tag{20}$$

Let $\frac{\partial \mathcal{L}}{\partial \overrightarrow{\alpha}} = 0$, $\frac{\partial \mathcal{L}}{\partial \overrightarrow{\beta}} = 0$, $\frac{\partial \mathcal{L}}{\partial \overrightarrow{\Lambda}} = 0$, we have

$$\forall i, \ 2 \begin{pmatrix} \overrightarrow{\alpha}_i^* \\ \overrightarrow{\beta}_i^* \end{pmatrix} = \begin{pmatrix} H_{i,11} & H_{i,12} \\ H_{i,21} & H_{i,22} \end{pmatrix} \begin{pmatrix} \overrightarrow{\Lambda} \\ \overrightarrow{0} \end{pmatrix}, \tag{21}$$

$$\forall t \quad \sum_{i=1}^{M} \alpha_{i,t} = 1. \tag{22}$$

By (22) we can get $\overrightarrow{e} = \sum_{i=1}^{M} \overrightarrow{\alpha}_i^* = \frac{1}{2}\sum_{i=1}^{M} H_{i,11}\overrightarrow{\Lambda}$ and compute $\overrightarrow{\Lambda}$. Bringing it to (21), we get $\overrightarrow{\alpha}_i^* = H_{i,11}(\sum_{j=1}^{M} H_{j,11})^{-1}\overrightarrow{e}$ and $\overrightarrow{\beta}_i^* = H_{i,21}(\sum_{j=1}^{M} H_{j,11})^{-1}\overrightarrow{e}$. Similar to A.2, we can prove that this stationary point is the global minima.

B Delta Method

B.1 Derivation of Delta Method

In this section, we introduce Delta Method [18], which is used for estimating the variance of WIS and WDR. Given a function of expectations of random variables $\theta = f(\mathbb{E}[\boldsymbol{X}])$, it is usually hard to obtain

10

an unbiased estimator. Luckily, if f is a continuous function, the empirical estimation $\hat{\theta} = f(\overline{X})$, where $\overline{X}$ is the sample mean of data, is strongly consistent. However, the samples are inside the function so the variance of $\hat{\theta}$ is hard to determine. We present the technology in Owen [18] here to build the framework of estimating variance for $\hat{\theta}$.

By first order Taylor expansion of f, $\hat{\theta}$ is approximated by

$$\hat{\theta} \approx \theta + \sum_{i=1}^{d} (\overline{X}_i - \mu_i) f_i(\mu), \tag{23}$$

where X_i is the i-th component of $\boldsymbol{X}$, $\mu_i = \mathbb{E}[X_i]$, and $f_i = \frac{\partial f}{\partial X_i}$. When the sample size n is large, $\overline{X}_i$ is very close to μ_i, so the right hand side is a good approximate of $\hat{\theta}$. The variance of $\hat{\theta}$ is then approximated by

$$\mathbb{V}[\hat{\theta}] \approx \frac{1}{n} \left(\sum_{i=1}^{d} f_i(\mu)^2 \sigma_i^2 + 2 \sum_{i=1}^{d-1} \sum_{j=i+1}^{d} f_i(\mu) f_j(\mu) \sigma_{i,j} \right) = \frac{1}{n} (\nabla f)^T \Sigma (\nabla f), \tag{24}$$

where σ_i^2 is the variance of X_i, $\sigma_{i,j}$ is the covariance of X_i and X_j, ∇f is the gradient of f and Σ is the corresponding covariance matrix.

B.2 Variance of Weighted Estimators

We estimate the variance of weighted estimators by (24). Define $\theta = f(\mu_x, \mu_y) = \frac{\mu_y}{\mu_x}$, where $\mu_x = \mathbb{E}[\boldsymbol{X}]$ and $\mu_y = \mathbb{E}[\boldsymbol{Y}]$, then $f_x = -\frac{\mu_y}{\mu_x^2}$, $f_y = \frac{1}{\mu_x}$. If we define $\sigma_x^2 = \mathbb{V}[\boldsymbol{X}]$, $\sigma_y^2 = \mathbb{V}[\boldsymbol{Y}]$, and $\sigma_{x,y} = Cov[\boldsymbol{X}, \boldsymbol{Y}]$, $\mathbb{V}[\hat{\theta}]$ is approximated by

$$\begin{aligned}
\mathbb{V}[\hat{\theta}] &= \frac{1}{n} \left(\frac{\mu_y^2 \sigma_x^2}{\mu_x^4} + \frac{\sigma_y^2}{\mu_x^2} - \frac{2\mu_y \sigma_{x,y}}{\mu_x^3} \right) \\
&= \frac{1}{n} \frac{\theta^2 \sigma_x^2 + \sigma_y^2 - 2\theta \sigma_{x,y}}{\mu_x^2} \\
&= \frac{1}{n} \frac{\theta^2 \sigma_x^2 + \sigma_y^2 - 2\theta \sigma_{x,y} + (\mu_y - \theta \mu_x)^2}{\mu_x^2} \\
&= \frac{1}{n} \frac{\mathbb{E}[\theta^2 \boldsymbol{X}^2] + \mathbb{E}[\boldsymbol{Y}^2] - 2\mathbb{E}[\theta \boldsymbol{X}\boldsymbol{Y}]}{\mu_x^2} \\
&= \frac{1}{n} \frac{\mathbb{E}[(\theta \boldsymbol{X} - \boldsymbol{Y})^2]}{\mu_x^2}.
\end{aligned} \tag{25}$$

B.3 Covariance of Weighted Estimators

To estimate the covariance, we define $\theta_1 = f(\mu_{x_1}, \mu_{y_1}) = \frac{\mu_{y_1}}{\mu_{x_1}}$ and $\theta_2 = f(\mu_{x_2}, \mu_{y_2}) = \frac{\mu_{y_2}}{\mu_{x_2}}$. The corresponding expectations, variances and covariances are represented by $\mu_{x_1}, \mu_{y_1}, \mu_{x_2}, \mu_{y_2}, \sigma_{x_1}^2, \sigma_{y_1}^2, \sigma_{x_2}^2, \sigma_{y_2}^2, \sigma_{x_1,x_2}, \sigma_{x_1,y_2}, \sigma_{y_1,x_2}, \sigma_{y_1,y_2}$. The covariance approximation $Cov[\hat{\theta}_1, \hat{\theta}_2]$ is

$$\begin{aligned}
Cov[\hat{\theta}_1, \hat{\theta}_2] &= \frac{1}{n} \left(\frac{\mu_{y_1} \mu_{y_2} \sigma_{x_1,x_2}}{\mu_{x_1}^2 \mu_{x_2}^2} - \frac{\mu_{y_1} \sigma_{x_1,y_2}}{\mu_{x_1}^2 \mu_{x_2}} - \frac{\mu_{y_2} \sigma_{y_1,x_2}}{\mu_{x_1} \mu_{x_2}^2} + \frac{\sigma_{y_1,y_2}}{\mu_{x_1} \mu_{x_2}} \right) \\
&= \frac{1}{n} \frac{\theta_1 \theta_2 \sigma_{x_1,x_2} - \theta_1 \sigma_{x_1,y_2} - \theta_2 \sigma_{y_1,x_2} + \sigma_{y_1,y_2}}{\mu_{x_1} \mu_{x_2}} \\
&= \frac{1}{n} \frac{\theta_1 \theta_2 \sigma_{x_1,x_2} - \theta_1 \sigma_{x_1,y_2} - \theta_2 \sigma_{y_1,x_2} + \sigma_{y_1,y_2} + (\mu_{y_1} - \theta_1 \mu_{x_1})(\mu_{y_2} - \theta_2 \mu_{x_2})}{\mu_{x_1} \mu_{x_2}} \\
&= \frac{1}{n} \frac{\mathbb{E}[\theta_1 \theta_2 \boldsymbol{X}_1 \boldsymbol{X}_2] - \mathbb{E}[\theta_1 \boldsymbol{X}_1 \boldsymbol{Y}_2] - \mathbb{E}[\theta_2 \boldsymbol{Y}_1 \boldsymbol{X}_2] + \mathbb{E}[\boldsymbol{Y_1} \boldsymbol{Y_2}]}{\mu_{x_1} \mu_{x_2}} \\
&= \frac{1}{n} \frac{\mathbb{E}[(\theta_1 \boldsymbol{X}_1 - \boldsymbol{Y}_1)(\theta_2 \boldsymbol{X}_2 - \boldsymbol{Y}_2)]}{\mu_{x_1} \mu_{x_2}}.
\end{aligned} \tag{26}$$

11

B.4 Variance of Summation of Weighted Estimators

358 We use the formulas in B.2 and B.3 to derive the variance of summation of weighted estimators.
359 Define $\theta = g(\mu_{x_1}, \mu_{y_1}, \mu_{x_2}, \mu_{y_2}, ..., \mu_{x_T}, \mu_{y_T}) = \sum_{t=0}^{T} \theta_t = \sum_{t=0}^{T} \frac{\mu_{y_t}}{\mu_{x_t}}$, where $\mu_{x_t} = \mathbb{E}[\boldsymbol{X}_t]$ and
360 $\mu_{y_t} = \mathbb{E}[\boldsymbol{Y}_t]$. Then

$$
\begin{aligned}
\mathbb{V}[\hat{\theta}] &\approx \sum_{t=0}^{T} \mathbb{V}[\hat{\theta}_t] + 2 \sum_{t=0}^{T-1} \sum_{\tau=t+1}^{T} Cov[\hat{\theta}_t, \hat{\theta}_\tau] \\
&= \frac{1}{n} \left(\sum_{t=0}^{T} \frac{\mathbb{E}[(\theta_t \boldsymbol{X}_t - \boldsymbol{Y}_t)^2]}{\mu_{x_t}^2} + 2 \sum_{t=0}^{T-1} \sum_{\tau=t+1}^{T} \frac{\mathbb{E}[(\theta_t \boldsymbol{X}_t - \boldsymbol{Y}_t)(\theta_\tau \boldsymbol{Y}_\tau - \boldsymbol{X}_\tau)]}{\mu_{x_t} \mu_{x_\tau}} \right) \\
&= \frac{1}{n} \mathbb{E}\left[(\sum_{t=0}^{T} \frac{\theta_t \boldsymbol{X}_t - \boldsymbol{Y}_t}{\mu_{x_t}})^2 \right].
\end{aligned} \tag{27}
$$

361 If we add the subscript i to the formula, the formula would be

$$
\mathbb{V}[\hat{V}_i] \approx \frac{1}{n_i} \mathbb{E}\left[(\sum_{t=0}^{T} \frac{\theta_{i,t} \boldsymbol{X}_{i,t} - \boldsymbol{Y}_{i,t}}{\mu_{x_{i,t}}})^2 \right]. \tag{28}
$$

362 If we use the samples $X_{i,j,t}$ and $Y_{i,j,t}$ to estimate $\mathbb{V}[\hat{V}_i]$, the estimated variance would be

$$
\begin{aligned}
Var_i &= \frac{1}{n_i^2} \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} \frac{\hat{Y}_{i,j,t} - \hat{\theta}_{i,t} \hat{X}_{i,j,t}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t}} \right)^2 \\
&= \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} \frac{\hat{Y}_{i,j,t} - \hat{\theta}_{i,t} \hat{X}_{i,j,t}}{\sum_{k=1}^{n_i} \hat{X}_{i,k,t}} \right)^2.
\end{aligned} \tag{29}
$$

363 We now show that $n_i * Var_i$ is strongly consistent. It is derived as

$$
\begin{aligned}
n_i * Var_i &= \frac{1}{n_i} \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} \frac{\hat{Y}_{i,j,t} - \hat{\theta}_{i,t} \hat{X}_{i,j,t}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t}} \right)^2 \\
&= \frac{1}{n_i} \sum_{j=1}^{n_i} \sum_{t=0}^{T} \sum_{\tau=0}^{T} \frac{\hat{Y}_{i,j,t} - \hat{\theta}_{i,t} \hat{X}_{i,j,t}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t}} \cdot \frac{\hat{Y}_{i,j,\tau} - \hat{\theta}_{i,\tau} \hat{X}_{i,j,\tau}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,\tau}} \\
&= \sum_{t=0}^{T} \sum_{\tau=0}^{T} \frac{\frac{1}{n_i} \sum_{j=1}^{n_i} (\hat{Y}_{i,j,t} - \hat{\theta}_{i,t} \hat{X}_{i,j,t})(\hat{Y}_{i,j,\tau} - \hat{\theta}_{i,\tau} \hat{X}_{i,j,\tau})}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t} \cdot \frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,\tau}} \\
&= \sum_{t=0}^{T} \sum_{\tau=0}^{T} \frac{\frac{1}{n_i} \sum_{j=1}^{n_i} \hat{Y}_{i,j,t} \hat{Y}_{i,j,\tau} + \frac{\hat{\theta}_{i,t} \hat{\theta}_{i,\tau}}{n_i} \sum_{j=1}^{n_i} \hat{X}_{i,j,t} \hat{X}_{i,j,\tau}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t} \cdot \frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,\tau}} \\
&\quad - \frac{\frac{\hat{\theta}_{i,t}}{n_i} \sum_{j=1}^{n_i} \hat{X}_{i,j,t} \hat{Y}_{i,j,\tau} + \frac{\hat{\theta}_{i,\tau}}{n_i} \sum_{j=1}^{n_i} \hat{X}_{i,j,\tau} \hat{Y}_{i,j,t}}{\frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,t} \cdot \frac{1}{n_i} \sum_{k=1}^{n_i} \hat{X}_{i,k,\tau}}.
\end{aligned} \tag{30}
$$

364 Therefore, $n_i * Var_i$ is strongly consistent for

$$
\begin{aligned}
E_i &= \sum_{t=0}^{T} \sum_{\tau=0}^{T} \frac{\mathbb{E}[\boldsymbol{Y}_{i,t} \boldsymbol{Y}_{i,\tau}] + \theta_{i,t} \theta_{i,\tau} \mathbb{E}[\boldsymbol{X}_{i,t} \boldsymbol{X}_{i,\tau}] - \theta_{i,t} \mathbb{E}[\boldsymbol{X}_{i,t} \boldsymbol{Y}_{i,\tau}] - \theta_{i,\tau} \mathbb{E}[\boldsymbol{X}_{i,\tau} \boldsymbol{Y}_{i,t}]}{\mu_{x_{i,t}} \mu_{x_{i,\tau}}} \\
&= \sum_{t=0}^{T} \sum_{\tau=0}^{T} \frac{\mathbb{E}[(\boldsymbol{Y}_{i,t} - \theta_{i,t} \boldsymbol{X}_{i,t})(\boldsymbol{Y}_{i,\tau} - \theta_{i,\tau} \boldsymbol{X}_{i,\tau})]}{\mu_{x_{i,t}} \mu_{x_{i,\tau}}} \\
&= \mathbb{E}\left[(\sum_{t=0}^{T} \frac{\boldsymbol{Y}_{i,t} - \theta_{i,t} \boldsymbol{X}_{i,t}}{\mu_{x_{i,t}}})^2 \right].
\end{aligned} \tag{31}
$$

B.5 Covariance of Summation of two Weighted Estimators

Similarly, we can estimate the covariance of $\hat{\theta}_1$ and $\hat{\theta}_2$, where $\hat{\theta}_1$ estimates $\theta_1 = g(\mu_{w_1}, \mu_{x_1}, \mu_{y_1}, \mu_{z_1}) = \frac{\mu_{x_1}}{\mu_{w_1}} + \frac{\mu_{z_1}}{\mu_{y_1}}$ and $\hat{\theta}_2$ estimates $\theta_2 = g(\mu_{w_2}, \mu_{x_2}, \mu_{y_2}, \mu_{z_2}) = \frac{\mu_{x_2}}{\mu_{w_2}} + \frac{\mu_{z_2}}{\mu_{y_2}}$.
Define $\theta_{11} = \frac{\mu_{x_1}}{\mu_{w_1}}, \theta_{12} = \frac{\mu_{z_1}}{\mu_{y_1}}, \theta_{21} = \frac{\mu_{x_2}}{\mu_{w_2}}, \theta_{22} = \frac{\mu_{z_2}}{\mu_{y_2}}$, then

$$
\begin{aligned}
Cov[\hat{\theta}_1, \hat{\theta}_2] &= Cov[\hat{\theta}_{11}, \hat{\theta}_{21}] + Cov[\hat{\theta}_{11}, \hat{\theta}_{22}] + Cov[\hat{\theta}_{12}, \hat{\theta}_{21}] + Cov[\hat{\theta}_{12}, \hat{\theta}_{22}] \\
&= \frac{1}{n}\Big(\frac{\mathbb{E}[(\theta_{11}\boldsymbol{W}_1 - \boldsymbol{X}_1)(\theta_{21}\boldsymbol{W}_2 - \boldsymbol{X}_2)]}{\mu_{w_1}\mu_{w_2}} + \frac{\mathbb{E}[(\theta_{11}\boldsymbol{W}_1 - \boldsymbol{X}_1)(\theta_{22}\boldsymbol{Y}_2 - \boldsymbol{Z}_2)]}{\mu_{w_1}\mu_{y_2}} + \\
&\qquad \frac{\mathbb{E}[(\theta_{12}\boldsymbol{Y}_1 - \boldsymbol{Z}_1)(\theta_{21}\boldsymbol{W}_2 - \boldsymbol{X}_2)]}{\mu_{y_1}\mu_{w_2}} + \frac{\mathbb{E}[(\theta_{12}\boldsymbol{Y}_1 - \boldsymbol{Z}_1)(\theta_{22}\boldsymbol{Y}_2 - \boldsymbol{Z}_2)]}{\mu_{y_1}\mu_{y_2}}\Big) \\
&= \frac{1}{n}\mathbb{E}\left[\Big(\frac{\theta_{11}\boldsymbol{W}_1 - \boldsymbol{X}_1}{\mu_{w_1}} + \frac{\theta_{12}\boldsymbol{Y}_1 - \boldsymbol{Z}_1}{\mu_{y_1}}\Big)\Big(\frac{\theta_{21}\boldsymbol{W}_2 - \boldsymbol{X}_2}{\mu_{w_2}} + \frac{\theta_{22}\boldsymbol{Y}_2 - \boldsymbol{Z}_2}{\mu_{y_2}}\Big)\right]. \quad (32)
\end{aligned}
$$

If we add the subscript i, replace the subscript of 1 by t_1 and 2 by t_2, and let $\theta_{11} = \nu_{i,t_1}, \theta_{12} = \omega_{i,t_1}, \theta_{21} = \nu_{i,t_2}, \theta_{22} = \omega_{i,t_2}$, then

$$
\begin{aligned}
&Cov[\hat{V}_{i,t_1}, \hat{V}_{i,t_2}] \\
&= \frac{1}{n_i}\mathbb{E}\left[\Big(\frac{\nu_{i,t_1}\boldsymbol{W}_{i,t_1} - \boldsymbol{X}_{i,t_1}}{\mu_{w_{i,t_1}}} + \frac{\omega_{i,t_1}\boldsymbol{Y}_{i,t_1} - \boldsymbol{Z}_{i,t_1}}{\mu_{y_{i,t_1}}}\Big)\Big(\frac{\nu_{i,t_2}\boldsymbol{W}_{i,t_2} - \boldsymbol{X}_{i,t_2}}{\mu_{w_{i,t_2}}} + \frac{\omega_{i,t_2}\boldsymbol{Y}_{i,t_2} - \boldsymbol{Z}_{i,t_2}}{\mu_{y_{i,t_2}}}\Big)\right].
\end{aligned}
$$
$$(33)$$

If we use samples to estimate the covariance, the estimator will be

$$
\begin{aligned}
Cov_{i,t_1,t_2} = \sum_{j=1}^{n_i} &\left(\frac{\hat{X}_{i,j,t_1} - \hat{\nu}_{i,t_1}\hat{W}_{i,j,t_1}}{\sum_{k=1}^{n_i} \hat{W}_{i,k,t_1}} + \frac{\hat{Z}_{i,j,t_1} - \hat{\omega}_{i,t_1}\hat{Y}_{i,j,t_1}}{\sum_{k=1}^{n_i} \hat{Y}_{i,k,t_1}}\right) \\
&\left(\frac{\hat{X}_{i,j,t_2} - \hat{\nu}_{i,t_2}\hat{W}_{i,j,t_2}}{\sum_{k=1}^{n_i} \hat{W}_{i,k,t_2}} + \frac{\hat{Z}_{i,j,t_2} - \hat{\omega}_{i,t_2}\hat{Y}_{i,j,t_2}}{\sum_{k=1}^{n_i} \hat{Y}_{i,k,t_2}}\right). \quad (34)
\end{aligned}
$$

Using the same technique as B.4, we can prove that $n_i * Cov_{i,t_1,t_2}$ is strongly consistent for $E_{i,t_1,t_2} = \mathbb{E}\left[(\frac{\nu_{i,t_1}\boldsymbol{W}_{i,t_1} - \boldsymbol{X}_{i,t_1}}{\mu_{w_{i,t_1}}} + \frac{\omega_{i,t_1}\boldsymbol{Y}_{i,t_1} - \boldsymbol{Z}_{i,t_1}}{\mu_{y_{i,t_1}}})(\frac{\nu_{i,t_2}\boldsymbol{W}_{i,t_2} - \boldsymbol{X}_{i,t_2}}{\mu_{w_{i,t_2}}} + \frac{\omega_{i,t_2}\boldsymbol{Y}_{i,t_2} - \boldsymbol{Z}_{i,t_2}}{\mu_{y_{i,t_2}}})\right]$.

C Formulations for the Estimators

C.1 General Formulations for the Estimators

The naive mixture estimators for the four methods are

$$
\hat{V}_{NMIS} = \sum_{i=1}^{M} \alpha_i \hat{V}_{IS,i} \quad (35)
$$

$$
\hat{V}_{NMDR} = \sum_{i=1}^{M} \alpha_i \hat{V}_{DR,i} \quad (36)
$$

$$
\hat{V}_{NMWIS} = \sum_{i=1}^{M} \alpha_i \hat{V}_{SWIS,i} \quad (37)
$$

$$
\hat{V}_{NMWDR} = \sum_{i=1}^{M} \alpha_i \hat{V}_{SWDR,i} \quad (38)
$$

After taking t into account, the mixture estimators for the four methods are

$$\hat{V}_{MIS} = \sum_{i=1}^{M} \sum_{t=0}^{T} \alpha_{i,t} \hat{V}_{IS,i,t} \tag{39}$$

$$\hat{V}_{MDR} = \sum_{i=1}^{M} \sum_{t=0}^{T} \alpha_{i,t} \hat{V}_{DR,i,t} \tag{40}$$

$$\hat{V}_{MWIS} = \sum_{i=1}^{M} \sum_{t=0}^{T} \alpha_{i,t} \hat{V}_{SWIS,i,t} \tag{41}$$

$$\hat{V}_{MWDR} = \sum_{i=1}^{M} \sum_{t=0}^{T} \alpha_{i,t} \hat{V}_{SWDR,i,t} \tag{42}$$

After splitting the control variates from DR and SWDR, the $\alpha\beta$ mixture estimators are

$$\hat{V}_{MDR} = \sum_{i=1}^{M} \sum_{t=0}^{T} (\alpha_{i,t} \hat{V}_{IS,i,t} + \beta_{i,t} \hat{W}_{DR,i,t}) \tag{43}$$

$$\hat{V}_{MWDR} = \sum_{i=1}^{M} \sum_{t=0}^{T} (\alpha_{i,t} \hat{V}_{SWIS,i,t} + \beta_{i,t} \hat{W}_{SWDR,i,t}) \tag{44}$$

C.2 Components of the Estimators

The sub-estimators in Appendix C.1 are listed below:

Method	Target	Formulation
IS	$\hat{V}_{IS,i}$	$\frac{1}{n_i} \sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t \rho_{i,j,t} r_{i,j,t}$
IS	$\hat{V}_{IS,i,t}$	$\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^t \rho_{i,j,t} r_{i,j,t}$
DR	$\hat{V}_{DR,i}$	$\frac{1}{n_i} \sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t \left(\rho_{i,j,t-1} \hat{V}(s_{i,j,t}) + \rho_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right)$
DR	$\hat{V}_{DR,i,t}$	$\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^t \left(\rho_{i,j,t-1} \hat{V}(s_{i,j,t}) + \rho_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right)$
DR	$\hat{W}_{DR,i,t}$	$\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^t \left(\rho_{i,j,t-1} \hat{V}(s_{i,j,t}) - \rho_{i,j,t} \hat{Q}(s_{i,j,t}, a_{i,j,t}) \right)$
SWIS	$\hat{V}_{SWIS,i}$	$\sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t u_{i,j,t} r_{i,j,t}$
SWIS	$\hat{V}_{SWIS,i,t}$	$\sum_{j=1}^{n_i} \gamma^t u_{i,j,t} r_{i,j,t}$
SWDR	$\hat{V}_{SWDR,i}$	$\sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t \left(u_{i,j,t-1} \hat{V}(s_{i,j,t}) + u_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right)$
SWDR	$\hat{V}_{SWDR,i,t}$	$\sum_{j=1}^{n_i} \gamma^t \left(u_{i,j,t-1} \hat{V}(s_{i,j,t}) + u_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right)$
SWDR	$\hat{W}_{SWDR,i,t}$	$\sum_{j=1}^{n_i} \gamma^t \left(u_{i,j,t-1} \hat{V}(s_{i,j,t}) - u_{i,j,t} \hat{Q}(s_{i,j,t}, a_{i,j,t}) \right)$

Table 2: Formulas for the components of the estimators.

C.3 Variance / Covariance Estimators for the Components

We can directly estimate the variances / covariances of components of IS and DR. In addition, with the formulas in Appendix B.4 and B.5, we can obtain the variance / covariance estimators for the components of SWIS and SWDR.

14

For naive mixture estimators, we need to estimate $\mathbb{V}[\hat{V}_{IS,i}]$, $\mathbb{V}[\hat{V}_{DR,i}]$, $\mathbb{V}[\hat{V}_{SWIS,i}]$ and $\mathbb{V}[\hat{V}_{SWDR,i}]$. They are formulated as

$$n_i \mathbb{V}[\hat{V}_{IS,i}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} \gamma^t \rho_{i,j,t} r_{i,j,t} \right)^2 - \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t \rho_{i,j,t} r_{i,j,t} \right)^2 \tag{45}$$

$$n_i \mathbb{V}[\hat{V}_{DR,i}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} \gamma^t \left(\rho_{i,j,t-1} \hat{V}(s_{i,j,t}) + \rho_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right) \right)^2$$
$$- \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \sum_{t=0}^{T} \gamma^t \left(\rho_{i,j,t-1} \hat{V}(s_{i,j,t}) + \rho_{i,j,t}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) \right) \right)^2 \tag{46}$$

$$n_i \mathbb{V}[\hat{V}_{SWIS,i}] \approx n_i \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} u_{i,j,t} \left(\gamma^t r_{i,j,t} - \hat{\theta}_{i,t} \right) \right)^2 \tag{47}$$

$$n_i \mathbb{V}[\hat{V}_{SWDR,i}] \approx n_i \sum_{j=1}^{n_i} \left(\sum_{t=0}^{T} u_{i,j,t} \left(\gamma^t \left(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t}) \right) - \hat{\nu}_{i,t} \right) \right.$$
$$\left. + \sum_{t=0}^{T} u_{i,j,t-1} \left(\gamma^t \hat{V}(s_{i,j,t}) - \hat{\omega}_{i,t} \right) \right)^2 \tag{48}$$

where $\hat{\theta}_{i,t} = \sum_{j=1}^{n_i} \gamma^t u_{i,j,t} r_{i,j,t}$, $\hat{\nu}_{i,t} = \sum_{j=1}^{n_i} \gamma^t u_{i,j,t} \left(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t}) \right)$ and $\hat{\omega}_{i,t} = \sum_{j=1}^{n_i} \gamma^t u_{i,j,t-1} \hat{V}(s_{i,j,t})$.

For mixture estimators, we will need to estimate $Cov[\hat{V}_{IS,i,t_1}, \hat{V}_{IS,i,t_2}]$, $Cov[\hat{V}_{DR,i,t_1}, \hat{V}_{DR,i,t_2}]$, $Cov[\hat{V}_{SWIS,i,t_1}, \hat{V}_{SWIS,i,t_2}]$ and $Cov[\hat{V}_{SWDR,i,t_1}, \hat{V}_{SWDR,i,t_2}]$. Their formulations are

$$n_i Cov[\hat{V}_{IS,i,t_1}, \hat{V}_{IS,i,t_2}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1+t_2} \rho_{i,j,t_1} \rho_{i,j,t_2} r_{i,j,t_1} r_{i,j,t_2}$$
$$- \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1} \rho_{i,j,t_1} r_{i,j,t_1} \right) \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_2} \rho_{i,j,t_2} r_{i,j,t_2} \right) \tag{49}$$

$$n_i Cov[\hat{V}_{DR,i,t_1}, \hat{V}_{DR,i,t_2}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \left(\gamma^{t_1} \left(\rho_{i,j,t_1-1} \hat{V}(s_{i,j,t_1}) + \rho_{i,j,t_1}(r_{i,j,t_1} - \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1})) \right) \right)$$
$$* \left(\gamma^{t_2} \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) + \rho_{i,j,t_2}(r_{i,j,t_2} - \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2})) \right) \right)$$
$$- \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1} \left(\rho_{i,j,t_1-1} \hat{V}(s_{i,j,t_1}) + \rho_{i,j,t_1}(r_{i,j,t_1} - \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1})) \right) \right)$$
$$* \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_2} \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) + \rho_{i,j,t_2}(r_{i,j,t_2} - \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2})) \right) \right) \tag{50}$$

$$n_i Cov[\hat{V}_{SWIS,i,t_1}, \hat{V}_{SWIS,i,t_2}] \approx n_i \sum_{j=1}^{n_i} u_{i,j,t_1} u_{i,j,t_2} \left(\gamma^{t_1} r_{i,j,t_1} - \hat{\theta}_{i,t_1} \right) \left(\gamma^{t_2} r_{i,j,t_2} - \hat{\theta}_{i,t_2} \right) \tag{51}$$

$$n_i Cov[\hat{V}_{SWDR,i,t_1}, \hat{V}_{SWDR,i,t_2}] \approx n_i \sum_{j=1}^{n_i} \left(u_{i,j,t_1} \left(\gamma^{t_1} \left(r_{i,j,t_1} - \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1}) \right) \right) - \hat{\nu}_{i,t_1} \right)$$
$$+ u_{i,j,t_1-1} \left(\gamma^{t_1} \hat{V}(s_{i,j,t_1}) - \hat{\omega}_{i,t_1} \right) \Bigg)$$
$$* \left(u_{i,j,t_2} \left(\gamma^{t_2} \left(r_{i,j,t_2} - \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) \right) \right) - \hat{\nu}_{i,t_2} \right)$$
$$+ u_{i,j,t_2-1} \left(\gamma^{t_2} \hat{V}(s_{i,j,t_2}) - \hat{\omega}_{i,t_2} \right) \Bigg) \tag{52}$$

392 For $\alpha\beta$ mixture estimators, we need to estimate $Cov[\hat{V}_{IS,i,t_1}, \hat{W}_{DR,i,t_2}]$, $Cov[\hat{W}_{DR,i,t_1}, \hat{W}_{DR,i,t_2}]$,
393 $Cov[\hat{V}_{SWIS,i,t_1}, \hat{W}_{SWDR,i,t_2}]$ and $Cov[\hat{W}_{SWDR,i,t_1}, \hat{W}_{SWDR,i,t_2}]$. They can be approximated by

$$n_i Cov[\hat{V}_{IS,i,t_1}, \hat{W}_{DR,i,t_2}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1+t_2} \rho_{i,j,t_1} r_{i,j,t_1} \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) - \rho_{i,j,t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) \right)$$
$$- \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1} \rho_{i,j,t_1} r_{i,j,t_1} \right)$$
$$* \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_2} \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) - \rho_{i,j,t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) \right) \right) \tag{53}$$

$$n_i Cov[\hat{W}_{DR,i,t_1}, \hat{W}_{DR,i,t_2}] \approx \frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1+t_2} \left(\rho_{i,j,t_1-1} \hat{V}(s_{i,j,t_1}) - \rho_{i,j,t_1} \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1}) \right)$$
$$* \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) - \rho_{i,j,t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) \right)$$
$$- \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_1} \left(\rho_{i,j,t_1-1} \hat{V}(s_{i,j,t_1}) - \rho_{i,j,t_1} \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1}) \right) \right)$$
$$* \left(\frac{1}{n_i} \sum_{j=1}^{n_i} \gamma^{t_2} \left(\rho_{i,j,t_2-1} \hat{V}(s_{i,j,t_2}) - \rho_{i,j,t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) \right) \right) \tag{54}$$

$$n_i Cov[\hat{V}_{SWIS,i,t_1}, \hat{W}_{SWDR,i,t_2}] \approx n_i \sum_{j=1}^{n_i} u_{i,j,t_1} \left(\gamma^{t_1} r_{i,j,t_1} - \hat{\theta}_{i,t_1} \right)$$
$$* \left(u_{i,j,t_2-1} \left(\gamma^{t_2} \hat{V}(s_{i,j,t_2}) - \hat{\phi}_{i,t_2} \right) - u_{i,j,t_2} \left(\gamma^{t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) - \hat{\psi}_{i,t_2} \right) \right) \tag{55}$$

$$n_i Cov[\hat{W}_{SWDR,i,t_1}, \hat{W}_{SWDR,i,t_2}] \approx n_i \sum_{j=1}^{n_i} \left(u_{i,j,t_1-1} \left(\gamma^{t_1} \hat{V}(s_{i,j,t_1}) - \hat{\phi}_{i,t_1} \right) - u_{i,j,t_1} \left(\gamma^{t_1} \hat{Q}(s_{i,j,t_1}, a_{i,j,t_1}) - \hat{\psi}_{i,t_1} \right) \right)$$
$$* \left(u_{i,j,t_2-1} \left(\gamma^{t_2} \hat{V}(s_{i,j,t_2}) - \hat{\phi}_{i,t_2} \right) - u_{i,j,t_2} \left(\gamma^{t_2} \hat{Q}(s_{i,j,t_2}, a_{i,j,t_2}) - \hat{\psi}_{i,t_2} \right) \right) \tag{56}$$

394 where $\phi_{i,t} = \sum_{j=1}^{n_i} \gamma^t u_{i,j,t} \hat{V}(s_{i,j,t})$ and $\psi_{i,t} = \sum_{j=1}^{n_i} \gamma^t u_{i,j,t} \hat{Q}(s_{i,j,t}, a_{i,j,t})$.

395 Note that all of the above estimators multiplied by n_i are strongly consistent for some value. Therefore,
396 we can easily show that the three mixture estimators are all strongly consistent for V.

D Experiment Details

D.1 Environmental Settings

In this section, there are no random variables so we use bold letters to denote vectors.

In the recommendation environment, we first define the number of topics $T = 100$. 1000 documents are generated and each is observed by a T dimension vector. Each document should reflect whether it is related to each topic and each user should indicate the preference of each topic. For the topics, we generate an abundance vector $\boldsymbol{A} = [A_1, A_2, ..., A_T]^T$ and a quality vector $\boldsymbol{Q} = [Q_1, Q_2, ..., Q_T]^T$. The abundance vector satisfies $\sum_{i=1}^{T} A_i = 1$ and $\forall i, A_i \geq 0$. When we generate a relevant topic for a document, the abundance vector specifies the probability of generating each topic. The quality vector satisfies $\forall i, 0 \leq Q_i \leq 1$, indicating the original quality of each topic.

For each document, we define relevance vector $\boldsymbol{r}_i \in \{0, 1\}^T$ and quality q_i. When the document sampler is generating the i-th document, it will first generate three topics t_1, t_2 and t_3 (repeatable) by $\boldsymbol{A}$, and set the t_1-th, t_2-th and t_3-th dimensions of $\boldsymbol{r}_i$ to 1 while setting the other dimensions to 0. The quality is calculated by $q_i = (\boldsymbol{Q}^T \boldsymbol{r}_i + U)/2$, where U is generated uniformly from $[0, 1]$. To simulate the real environment, only $\boldsymbol{r}_i$ of each document can be observed.

At each time, the hidden state consists of

- user id i, indicating the current user;

- interest I, determining the satisfaction of the user;

- satisfaction s, influencing the reward of policy;

- document vector $\boldsymbol{d}$, the relevance vector of the current document.

We generated 5 preference vectors $\boldsymbol{p}_i \in [-1, 1]^T$. Each of them represents one user. When the user sampler generates the initial state, it randomly pick one from the 5 users, generate an initial interest I, and set the satisfaction by $s = \frac{1}{1+e^{-0.5I}}$. The initial document vector is set as $[1, 1, ..., 1]^T$. To simulate the real environment, only i and $\boldsymbol{d}$ can be observed by the agent.

Now we define the reward function and the state transition function. Suppose we recommend the j-th document to the i-th user. We define the liking of the user to the document by $l_{i,j} = \overrightarrow{e}^T (\boldsymbol{r}_j \circ \boldsymbol{p}_i \circ (\boldsymbol{d} + 0.5)/2)$, where $\circ$ is element-wise multiplication. This formula indicates the expectation of the user about the next document. It should be close to his or her preference as well as the current document. The probability of taking the document is $\frac{l_{i,j}}{1+l_{i,j}}$ while the probability of leaving is $\frac{1}{1+l_{i,j}}$. If the user takes the document, we will calculate its engagement time by $t_{i,j} \sim \mathcal{N}(q_j, 0.1^2)$ and produce the reward of $s * e^{t_{i,j}}$. The reward depends on the quality of the document as well as the user satisfaction.

After the choice of user, the state vector will change. The interest will be updated by $I' = 0.9I + \boldsymbol{p}_i^T \boldsymbol{r}_j + V$, where $V \sim \mathcal{N}(0, 0.1^2)$. Meanwhile, the document vector is updated by $\boldsymbol{d}_i' = \boldsymbol{r}_j$. Note we also need to update the interest by $s' = \frac{1}{1+e^{-0.5I'}}$.

D.2 Implementation of REINFORCE

In the above environment, at each step, the agent needs to propose a document only with i, $\boldsymbol{d}$ and document list $[\boldsymbol{r}_1, \boldsymbol{r}_2, ..., \boldsymbol{r}_D]$. We can train a policy network to represent the policy $\pi(a|s)$. However, when the list is long(action space is large), it is hard to directly output the policy $\pi(a|s)$ from neural networks. To exploit the structure of documents, we reduce the output of the policy network to a T dimension vector $\boldsymbol{y}$ and compute the policy by $\pi(a_i|s) \propto \boldsymbol{y}^T \boldsymbol{r}_i$. This not only solves the above problem but also reduces the time complexity of sampling. We initialize $\boldsymbol{b}_i = \sum_{j=1}^{i} \boldsymbol{r}_j$. When sampling, we can generate a number c from $[0, 1]$ and use binary search to find the smallest k satisfying $\boldsymbol{y}^T \boldsymbol{b}_k \geq c$. The k-th document would then be the sampled document. The time complexity is $O(TlogD)$, which is useful when the document list is long.
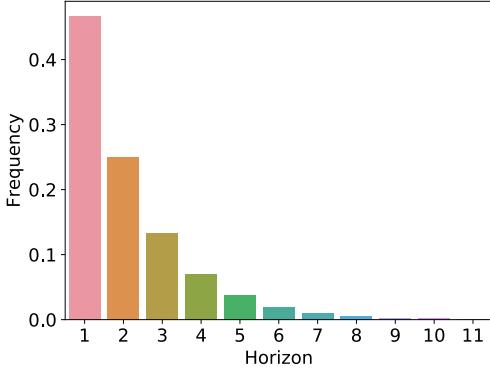

Figure 2: Distribution of length of data.

Figure 3: MSE of the methods with different T.

D.3 Implementation of OPE Algorithms

In the same environment, we train 100 different REINFORCE policies $p_1, p_2, ..., p_{100}$. Each policy collects 1000000 offline data, with the i-th defined by $DATA_i$. In our experiments, the policies are set up as target policy and behavior policies in turn. Specifically, for the i-th experiment, we set the target policy as p_i and use $DATA_i$ to estimate the true mean reward $\bar{\theta}_i$. The behavior policies are set as $\forall j \in \{1, 2, ..., M\}$ $\pi_j = p_{(i+j-1)\%100+1}$ and the offline data are $(DATA_{i+1}, DATA_{i+2}, ..., DATA_{(i+j-1)\%100+1})$. With the settings, the i-th evaluation result is $\hat{\theta}_i$ and the squared error is computed by $(\hat{\theta}_i - \bar{\theta}_i)^2$. We use the first 50 experiments as validation set to tune parameters and the last 50 experiments as test set to report the results.

We trained DM with 10000 data. The reward function $\mathbb{E}[R(s, a)]$ is approximated by Bayesian Ridge Regressor [19]. The transition function $P(\cdot|s, a)$ is approximated by neural network. The network consists of 2 fully connected layers with 512 units and an output layer with 2 units. The hidden layers are activated by relu and the last layer is activated by softmax. We minimize the cross entropy loss function with Adam optimizer [12]. The batch size is 32 and we train for 600 epochs. For the first 300 epochs the learning rate is set as 0.0001. For the last 300 epochs the learning rate is 0.00001. After approximating the environment functions, we iterate by formula (1) for 20 times and get the estimated value functions $\hat{Q}(s, a)$ and $\hat{V}(s)$.

To reduce the variance of the methods we clip the importance ratios. For IS based methods we replace $\rho_{i,j,t}$ by $\overline{\rho_{i,j,t}} = \min(\rho_{i,j,t}, 2000)$. For DR based methods we make $\hat{V}_{i,j,t} = \gamma^t(\overline{\rho_{i,j,t-1}}\frac{\pi(a_{i,j,t}|s_{i,j,t})}{\pi_i(a_{i,j,t}|s_{i,j,t})}(r_{i,j,t} - \hat{Q}(s_{i,j,t}, a_{i,j,t})) + \overline{\rho_{i,j,t-1}}\hat{V}(s_{i,j,t}))$. Note that clipping introduces additional bias. So our methods can be further improved by considering the bias.

D.4 Tuning of Hyperparameter T

In mixture estimators and $\alpha\beta$ mixture estimators, we choose a hyper-parameter T, mix the values from 0 to T and simply add up the remains. This is because the length of data from each behavior policy is random, as Figure 2. When t is large, the reward decreases exponentially and the variances and covariances about $\hat{V}_{i,t}$ also decreases, making the matrixes nearly singular. Such problem leads to the phenomenon in Figure 3. Numerical results can be found in Appendix E.1. When T is small, the MSE decreases as T increases because more values are mixed. When T is large, the MSE increases as T increases because of the amplification of error from ill covariance matrixes. By Figure 3, we set T=4 for MIS, MWIS, $\alpha\beta$ MDR and $\alpha\beta$ MWDR and set T=5 for MDR and MWDR.
